G. Kozicki 20.05.2015

Cele:

- -> "zszycie" dekad
- -> sprawdzenie skalowania się poziomu gęstości widmowej wraz z Vrms generatora
- -> sprawdzenie szumów własnych generatora
- -> spektrum z podpiętą sondą 41800A (zwarta 0 ohm)

Szum biały:

noise20mV - 20mVrms z generatora x 300 noise15mV - 15mVrms z generatora x 300 noise10mV - 10mVrms z generatora x 300 noise9mV - 9Vrms z generatora x 300 noise8mV - 8mVrms z generatora x 300 noise7mV - 7mVrms z generatora x 300 noise6 09mV - 6.09mVrms z generatora x 300

noise0mV - zwarcie przez 50 ohm x 300

6.09 mV rms - najniższa wartość skuteczna szumu białego dla hp33120A

Ustawienia:

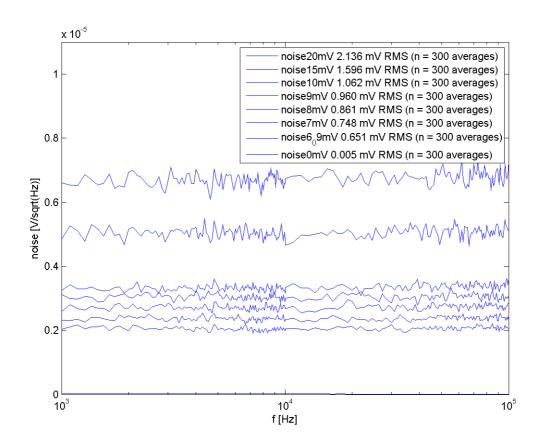

analyzer type: spectrum

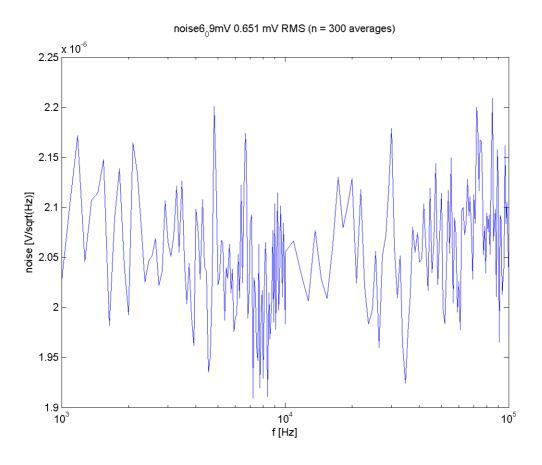

format: noise

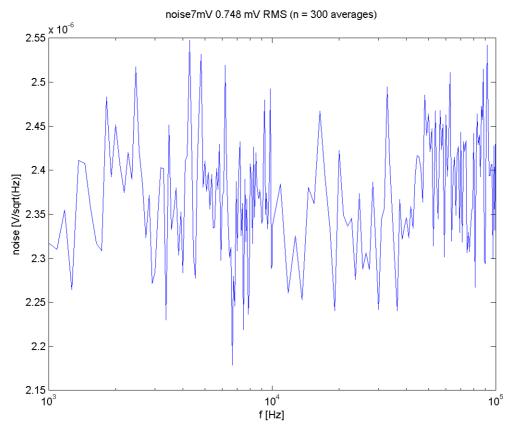

V

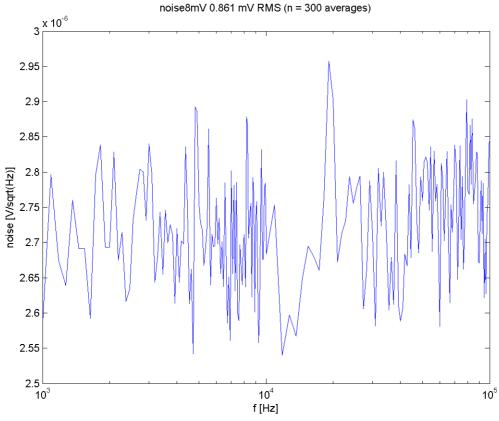

sweep type list start stop bw points 1kHz 10kHz 100Hz 100 10kHz 100kHz 1kHz 100

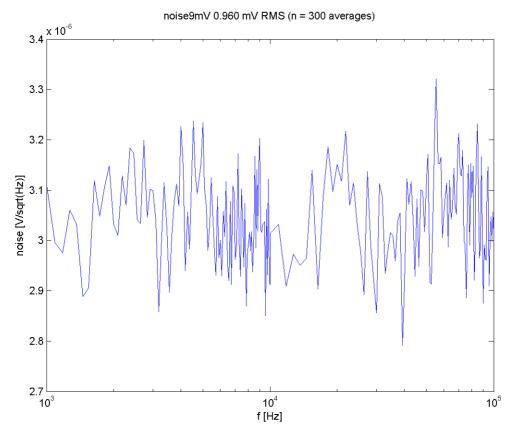

Dwie dekady: 1k - 10k, 10k - 100k Hz

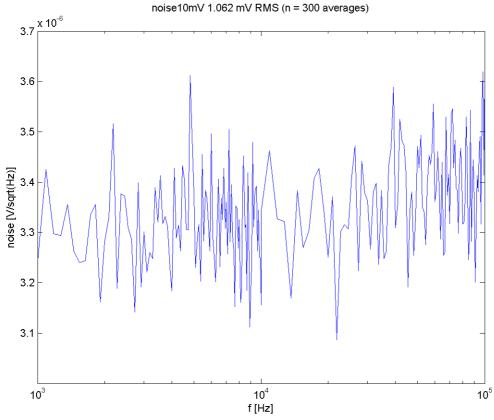

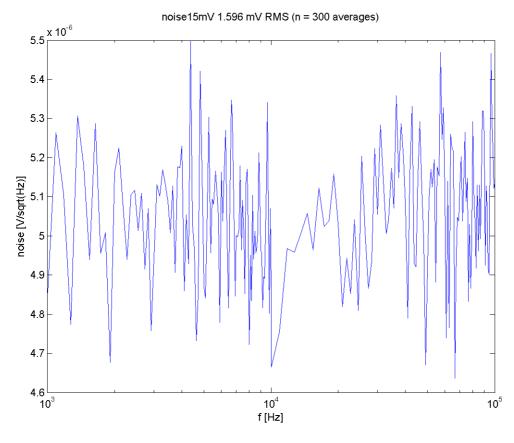

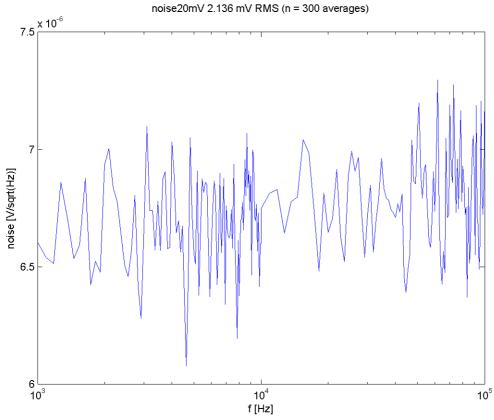

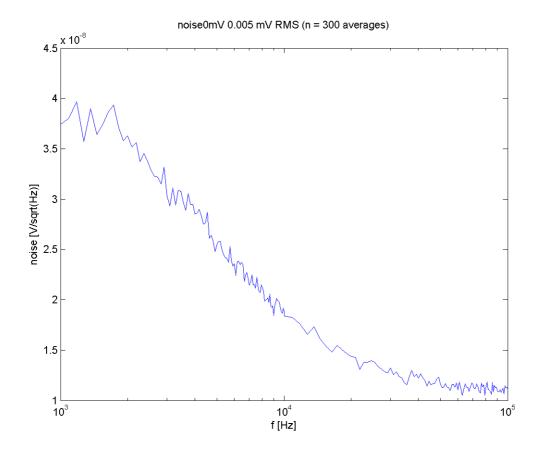

Sonda (zwarcie 0 ohm)
